

Shop Performance Dashboard

Key Insights

1. **Electronics drives over half of all revenue, but Accessories sells the most units.** Electronics generated **\$1.51M (50.6%)** of total recognised revenue from 33,506 units, while Accessories sold **35,031 units** (the highest volume) but contributed only **\$481K (16.1%)**. The shop depends on high-value electronics items for revenue, while accessories drive customer volume.
2. **Revenue was stable for two years, then dropped sharply in 2026.** Monthly revenue held steady at **\$95K–\$113K** from January 2024 through January 2026. From February 2026 onward, it fell to **\$65K–\$75K per month** — a **35% decline** that warrants immediate investigation.
3. **8% of orders never convert to revenue.** Of 50,000 orders, **4,015 were cancelled (4.9%) or returned (3.1%)**. Additionally, payment failure rates are consistent across all methods at **3.6–4.0%**. Combined, roughly **1 in 12 orders** generates no revenue — a significant leakage point.
4. **VIP customers underperform their segment.** VIP customers generated only **\$288K (9.7%)** of revenue, while Regular customers drove **\$1.66M (55.5%)** and New customers **\$1.04M (34.8%)**. The VIP segment is not delivering proportionally higher value.
5. **Higher discounts reduce average order value.** Orders with 0% discount average **\$74.54** per order, while orders with 21%+ discounts average only **\$56.06** — a **25% lower AOV**. Discounts are eroding revenue without driving larger basket sizes.

Recommendations for the Head of Operations

1. **Investigate the 2026 revenue decline**
Revenue dropped **35%** from ~\$107K/month to ~\$65–75K/month starting February 2026. Determine whether this reflects fewer recorded months, a seasonal dip, or a real business downturn. If real, prioritise marketing spend and customer retention campaigns in the affected period.
2. **Reduce cancellations and returns**
8% of orders (4,015) are cancelled or returned, representing significant lost revenue. Set a target to halve this to 4% by improving product descriptions, delivery reliability, and post-purchase support. Even a **1% reduction** would recover an estimated **\$30K** in annualised revenue.
3. **Optimise the discount strategy**
Higher discounts correlate with **lower** average order values (\$74.54 at 0% vs \$56.06 at 21%+). Discounts are eroding margin without driving larger baskets. Test capping discounts at **10–20%** and measure the impact on both order volume and total revenue. Also review the VIP segment — at 9.7% of revenue, VIP customers are not delivering proportionally higher value and may need targeted retention offers.

Data Problems Found & Handled		
Problem	Count	Decision
Duplicate order rows	120	Dropped exact duplicates
Unparseable OrderDates	35	Kept rows, excluded from time charts
Invalid Quantity (≤0 or null)	105	Kept rows, revenue set to 0
Missing Discount	220	Filled with 0 (no discount)
Missing PaymentMethod	450	Labelled 'Unknown'
